               The present sequence represents polypeptide R1, a new N-terminal choline binding protein A (CbpA) truncate derived from the CbpA of Streptococcus pneumoniae serotype type 4. Host-vector systems for production of R1 and other CbpA truncated polypeptides are provided. The invention relates generally to novel N-terminal CbpA truncates and polynucleotides encoding them, host-vector systems, and antibodies that specifically bind to the polypeptides. The invention also relates to vaccines including CbpA polypeptides, which provide protection or elicit protective antibodies to bacterial infection, specifically penumococcus, and to use of
                                                                                                                                                                                                                                                                                                                                                                             New N-terminal choline binding protein A truncate polypeptides, develop products for the diagnosis, prevention and treatment of

                            vaccines comprising the polypeptides or encoding nucleic acids can be used for treating a subject infected with or exposed to a pneumococcal bacterium. Antibodies specifically binding the polypeptides can be used for detection and diagnosis and for preventing pneumococcal attachment t a mucosal surface. The products can be used in humans and other animals such as domestic animals, such as feline or cannine subjects, farm animal such as bovine, equine, caprine, ovine, and porcine subjects, wild animals (whether in the wild or in a zoological garden), research animals, such as mice, rats, rabbits, goats, sheep, pigs, dogs, cats, i.e. for veterinary medical use.
                                                                                                                                                                             The invention provides novel isolated polypeptides comprising the amino acid sequence of an N-terminal choline binding protein A (CbpA) truncate (CbpAT). The polypeptides can be selected from sequences shown in ANY49225, ANY49227, ANY49230, ANY49231, ANY49233 and ANY49238. The polypeptides can be used for inducing an immune response in a subject which has been exposed to or infected with a pneumococcal bacterium. The can also be used for preventing infection by a pneumococcal bacterium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT
                                                               The present sequence represents polypeptide R2, a new N-terminal choline binding protein A (CDpA) truncate of Streptococcus pneumoniae serotype type 4. Host-vector systems for production of R2 and other N-terminal CDpA truncates are provided. Important features of R2 include: (1) complete correlation of bioactivity with full-length CDpA for recognition of purified glycoconjugate receptor analogues, ung cells and animal models; and (2) cross-protection between type 4 derived agents and bacteria in in vitro assays using other serotypes (e.g. 6B and 2), important for use in vaccine, prophylaxis and therapy. The invention relates generally to novel N-terminal CDpA truncates and polynucleotides encoding them, host-vector systems, and antibodies that specifically bind to the truncates. The invention also relates to vaccines including N-terminal CDpA truncates, which provide protection or elicit protective antibodies to bacterial infection, specifically pneumococcus, and to use of antibodies and antagonists against such polypeptides in diagnosis

                                                                                                                                                                                                                                                               animals,
                                                                                                                                                                                                                                                                            such as bovine, equine, caprine, ovine, and porcine subjects, wild animals (whether in the wild or in a zoological garden), research
                                                                                                                                                                                                                                                                                                           Vaccines comprising the polypeptides or encoding nucleic acids can be used for treating a subject infected with or exposed to a pneumococcal bacterium. Antibodies specifically binding the polypeptides can be used for detection and diagnosis and for preventing pneumococcal attachment to a mucosal surface. The products can be used in humans and other animals such as domestic animals, such as feline or canine subjects, farm animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 7; Page 7; 85pp; English.

                                                                                                                                                                                                                                                                                                                                                                      sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a

                                                                                                                                                                                                                                                                                                                                                                                                   AAY49137-Y49152 are amino acid sequences that are fragments of choline binding proteins (CBP). The fragments of the protein are the alpha helix forming parts of the CBPs from Streptococcus pneumoniae. The polypeptides do not contain the actual choline binding fragment. The polypeptides and the nucleotide sequences that encode them (AAZ31077-231092) are used in the invention, which relates to polypeptide truncates of a pneumococcal surface binding protein containing the highly conserved immunogenic alpha helical portion and no choline binding portion. The polypeptides are used as immunogens in a bacterial vaccine.
                                                                                                                                                                                                                                                                                                           The vaccine can be used for preventing (immunising) or treating invasive bacterial (especially pneumococcal) infections, especially otitis media (caused by S.pneumoniae), sepsis, meningitis and lobar pneumonia infections. Antibodies raised against the polypeptide are useful for detection, prevention (passive immunity) and treatment of S. pneumoniae infections. The vaccines are especially useful in immunocompromised patients, those with an immature immune system, or patients with an on

                                                                                                                                                                                                                                                                                                                                                                                             polypeptides do not contain the actual choline binding fragment. The polypeptides and the nucleotide sequences that encode them (AAZ31077-Z31092) are used in the invention, which relates to polypeptide truncates of a pneumococcal surface binding protein containing the highly conserved immunogenic alpha helical portion and no choline binding portion. The polypeptides are used as immunogens in a bacterial vaccine. The vaccine can be used for preventing (immunising) or treating invasive bacterial (especially pneumococcal) infections, especially otitis media (caused by S. pneumoniae), sepsis, meningitis and lobar pneumoniae infections. Prevention (passive immunity) and treatment of S. pneumoniae infections. The vaccines are especially useful in immunocompromised patients, those with an immature immune system, or patients with an on
                                                                                                                                                                                                                                                                                                                                                  going pneumococcal infection. The vaccine avoids unnecessary expense and provides broad protection against a range of pneumococcal serotypes and it produces an improved and enhanced effect in preventing bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY49137-Y49152 are amino acid sequences that are fragments of choline binding proteins (CBP). The fragments of the protein are the alpha helix forming parts of the CBPs from Streptococcus pneumoniae. The

They can also be used for preventing infection by a pneumococcal bacterium. Vaccines comprising the polypeptides or encoding nucleic acids can be used for treating a subject infected with or exposed to a pneumococcal bacterium. Antibodies specifically binding the polypeptides can be used for detection and diagnosis and for preventing pneumococcal attachment to a mucosal surface. The products can be used in humans and other animals and contact the products can be used in humans and other animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Choline binding protein A_i CbpA_i truncate; immune response; infection; pneumococcal bacterium; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptococcus pneumoniae CbpA. Claimed vaccines contain and N-terminal CbpA truncate such as the present sequence, or a polypeptide comprising a conserved region of the CbpA truncate. The vaccines provide protection or elicit protective antibodies to bacterial infection, specifically pneumococcus. Antibodies and and antagonists against the N-terminal CbpA truncates are used in

They can also be used for preventing infection by a pneumococcal bacterium. Vaccines comprising the polypeptides or encoding nucleic acids can be used for treating a subject infected with or exposed to a pneumococcal bacterium. Antibodies specifically binding the polypeptides can be used for detection and diagnosis and for preventing pneumococcal attachment to a mucosal surface. The products can be used in humans and other animals such as domestic animals, such as feline or canine subjects, farm animals such as bovine, equine, caprine, ovine, and porcine subjects, wild animals, such as mice, rats, rabbits, goats, sheep, pigs, dogs, cats, i.e. for veterinary medical use.

AAU03601-AAU03722 represent Group B Streptococcus (Streptococcus agalactiae) amino acid sequences of the invention. S. agalactiae is an encapsulated bacterium which is a major pathogen of humans causing sepsis and meningitis in neonates as well as adults. The S. agalactiae antigenic polypeptides are used to vaccinate against Group B Streptococcus infections, particularly to prevent infection in new born children arising from the maternal genital tract. An immunogenic composition is useful in the preparation of a medicament for the treatment or prophylaxis of Group B Streptococcus infection. The invention does not have the disadvantages of varied response rate associated with prior art capsid polysaccharide vaccination against Group B Streptococcus.
                                                                                                                                                                                                          New polypeptides derived from Streptococcus agalactiae are useful to provide detection of, and vaccination against, Group B Streptococcus infections, particularly to prevent infection in neonatals
                                                                                                                                                                                                                                                                                                                                                                                                          07-SEP-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO200132882-A2

                                                                                polypeptides can be used for inducing an immune response in a subject which has been exposed to or infected with a pneumococcal bacterium. The can also be used for preventing infection by a pneumococcal bacterium. Vaccines comprising the polypeptides or encoding nucleic acids can be used for treating a subject infected with or exposed to a pneumococcal bacterium. Antibodies specifically binding the polypeptides can be used for detection and diagnosis and for preventing pneumococcal attachment to mucosal surface. The products can be used in humans and other animals such as domestic animals, such as feline or canine subjects, farm animals such as domestic animals, such as feline or canine subjects, farm animals
                                                        such as bovine, equine, caprine, ovine, and porcine subjects, wild animals (whether in the wild or in a zoological garden), research
                                                                                                                                                                                                                  The invention provides novel isolated polypeptides comprising the amino acid sequence of an N-terminal choline binding protein A (CbpA) truncate (CbpAT). The polypeptides can be selected from sequences shown in AAY49225, AAY49227, AAY49230, AAY49231, AAY49233 and AAY49238. The

                                                                                                                                        This sequence represents the choline binding protein A (CbpA) of Streptococcus pneumoniae serotype type 4. The invention provides novel N-terminal CbpA truncated polypeptides (see AAV32098-110 and AAV32179-90) and polynucleotides encoding them, host-vector systems, and antibodies that specifically bind to the polypeptides. The invention also relates to vaccines including the polypeptides, which provide protection or elicit protective antibodies to bacterial infection, specifically pneumococcus, and to antibodies and antagonists against such polypeptides for use in diagnosis and passive immunotherapy. The polypeptides and/or polynucleotides are also useful as competitive inhibitors of bacterial adhesin of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent. specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antiinflammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be used in vaccines and in diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitts. AAA05591 to AAA05614 represent primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Streptococcus pneumoniae; vaccine; antibacterial; antiinflammatory; mu pneumococcal disease.

                                                                                                                                                                                                                                                              Best
                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klabsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery
                                                                                                                                                                                                                                                                                                                                                                            programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
Antisense; prokaryotic cellular proliferation protein; antibiotic; antibacterial; drug design.
                                       Haemophilus influenzae cellular proliferation protein #325
                                                                                                                       AAU35684 standard; Protein; 781
                                                                                                                                                                                                                                                                                                                                                       of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Entercoccus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery are transmitted to the compounds of the expressed proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                           programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

                                                                                                                       Ş
                                                                                                                                                                                                                                                                             The inventors claim a virus comprising a genome hybridisable with the nucleotide sequence of RNA 1 or RNA 2; pref. the sequences are those given in Figs 1 and 2 of the specification. Isolated proteins or polypeptide prepn. of the proteins or polypeptides derivable from the virus are also claimed.

H. armigera larvae were raised and viral RNA was extracted. The virus RNAs were reverse transcribed into cDNA. Clone E3 represents 99.7% or RNA 1.(hr236 contains about 88% or RNA 2.)The full length clone of RNA 1 was completed using PCR. RNA 1 encodes a protein of mol. wt. 187,000 which is regarded as the replicase in view of its AA sequence similarity in certain limited regions to replicases of of other RNA viruses. The apparent mol. wt. of this protein upon in vitro translation of virus RNA and SDS-PAGE is 195,000. The sequence given in Figure 1 is in the same sense as the viral (positive-sense) RNA. There are other small ORFs at the 3' end, corresp. to the proteins P11a, P11b and P14.

penicillin-binding protein 1A - Streptococcu
C:Species: Streptococcus pneumoniae
C:Date: 07-Apr-1994 #sequence_revision 07-Ap
C:Accession: A42893
R:Martin, C: Briese, T: Hakenbeck, R.
J. Bacteriol. 174, 4517-4523, 1992
A:Title: Nucleotide sequences of genes encod
A and 1B.
A:Reference number: A42893; MUID:92325042
A:Accession: A42893
A:Status: preliminary
A:Residues: 1-719 <MARN
A:Residues: 1-719 <MARN
A:Residues: 1-719 <MARN
A:Cross-references: GB:M90527; NID:9153766;
C:Superfamily: penicillin-binding protein 1B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT

SUBCELLULAR LOCATION: Mitochondrial matrix.
DOMAIN: APPEARS TO CONTAIN TWO DOMAINS OF APPROXIMATELY EQUAL
WHICH ARE SEPARATED BY A LOOP-LIKE SEQUENCE.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M16; ALSO KNOWN AS THE
INSULINASE FAMILY. DOES NOT SEEM TO HAVE A PROTEASE ACTIVITY.
                                                                                                                                                                                                                                                           Biol. Chem. 265:9881-9887(1990).
